#### Title Statement

*Title:* Annual Survey of Jails, 2023

*Alternative Title:* ASJ 2023

*Identification No.:* 39202

#### Responsibility Statement

*Authoring Entity:* United States Department of Justice. Office of Justice Programs. Bureau of Justice Statistics

#### Production Statement

*Producer:* Inter-university Consortium for Political and Social Research

*Place of Production:* Ann Arbor, MI: Inter-university Consortium for Political and Social Research

#### Series Statement

*Series Name:* Annual Survey of Jails Data Series

#### *Series Information:*

The Annual Survey of Jails (ASJ), formerly known as National Survey of Jails, provides data on local jails and jail inmates. The series was conducted annually from 1982 to 2023 except in 1983, 1988, 1993, 1999, 2005, and 2019, when the Census of Jails was conducted. From 1982 to 2014, the Census Bureau collected data for Bureau of Justice Statistics (BJS). After 2014, the ASJ data were collected by RTI, International. The ASJ was discontinued in 2024, when BJS transitioned to conducting the Census of Jails on an annual basis.

*Years Produced:* Annually 1982 to 2023, except in years when the Census of Jails is conducted.

### Study Scope

#### Subject Information

*Keyword(s):* correctional facilities, correctional system, demographic characteristics, jail inmates, jails, population characteristics

*Topic Classification(s):* Social Institutions and Behavior, Crime and the Criminal Justice System, Corrections

#### Abstract

BJS conducts the Census of Jails to collect data on the size of the jail population and selected inmate characteristics every five to six years. In years between censuses, BJS conducts the ASJ to produce national estimates on jail population size and characteristics. Key statistics include confined jail population, average daily population, rated capacity, supervised unconfined population, and admissions and releases. Data on jail population by sex, race, and conviction status are also collected, as well as data on juvenile population and the number of inmates held for state and federal authorities.

#### Summary Data Description

## - Study 39202 -

*Time Period:* July 1, 2022 - June 30, 2023

*Date(s) of Collection:* July, 2023 - December, 2023

*Country:* United States

*Geographic Coverage:* United States

*Geographic Unit:* City and County

*Unit of Analysis:* Jail Jurisdictions

*Universe:* All active jail jurisdictions (i.e., counties, municipalities, boroughs, etc.) in the United States as of June 30, 2023, excluding jails in Indian countries.

*Kind of Data:* Survey data

### Notes

#### DEFINITION OF TERMS

- Local jail: A confinement facility usually administered by a local law enforcement agency, intended for adults but sometimes also containing juveniles, that holds persons detained pending adjudication and/or persons committed after adjudication for sentences usually a year or less. Excluded from the survey are temporary holding or lockup facilities that are not part of a combined function of a jail jurisdiction, from which inmates are usually transferred within 72 hours and not held beyond arraignment.
- Jail jurisdiction: A county (parish in Louisiana), municipality, township, or regional authority that administers one or more local jails.
- Regional jail: A jail in which two or more jurisdictions have a formal agreement to operate the facility.
- Juvenile: A person subject to the exercise of juvenile court jurisdiction for the purposes of adjudication and treatment based on the age and offense limitations as defined by state law. In the ASJ, a person age 17 or younger is considered a juvenile even though they may be tried as an adult in criminal court.
- Adult criminal offender: A person subject to the original jurisdiction of the criminal court rather than the juvenile court because at the time of the offense the person was above a statutory age limit.
- Average daily population: To calculate the average daily population, respondents were instructed to add the number of persons for each day during the period of one year, and divide the sum by 365 (or 366 for a leap year).

#### JAIL UNIVERSE

The universe of the ASJ consists of all local jail jurisdictions, including country, city, regional, and privately operated jails. Jail facilities typically hold inmates beyond arraignment, a period normally exceeding 72 hours. Separate temporary holding facilities such as drunk tanks and police lockups are excluded that do not hold persons after they have been formally charged in court, unless the temporary holding facilities are operated as part of a local jail. Also excluded are Federal Bureau of Prisons (BOP) detention facilities and combined jail and prison systems in Alaska, Connecticut, Delaware, Hawaii, Rhode Island, and Vermont. These combined systems are operated by state departments of corrections and included in BJS's National Prisoner Statistics program. However, there are 15 independently operated jails in Alaska, which are included in the universe of the ASJ.

#### JAIL JURISDICTION AND REPORTING UNIT

The ASJ is a nationally representative survey of county or city jail jurisdictions and regional jails in the country. A jail jurisdiction is a county (parish in Louisiana) or municipal government that administers one or more local jails and represents the entity responsible for managing the jail facilities under its authority. Most jail jurisdictions consist of a single facility, but some contain multiple facilities and/or multiple facility operators, called reporting units. For example, two reporting units in Milwaukee County, Wisconsin--Milwaukee County House of Correction and Milwaukee County Sheriff's Office--represent a single jail jurisdiction.

Jail reporting units are identified by the 21-digit GID (variable name GID). The GID is a government identification code that the U.S. Census Bureau uses to identify governments in the United States based on the 2009 Census of Governments. The GID code identifies the general location of governments, and indicates whether they are state, county, city, place, or municipality organizations. The GID for a small number of jails changed over time due to changes in jail governing body (e.g., private vs. public). To facilitate linking jail

## - Study 39202 -

reporting units over time, an alternative reporting unit ID (variable name ID, an 8-digit number which starts with 1095) is provided for 2015-2018 and 2020-2023 ASJ data.

Jurisdictions are identified by the 9-digit JURISID. All reporting units that fall under the same jurisdictions share the same JURISID. For most jails, JURISID is the same as the first 9 digits of the GID. For privately-operated jails, the third positions digits of GID and JURISID are different.

### REFERENCE DATE

The ASJ collects total and disaggregated counts of jail inmates held on the last weekday of June (midyear reference date), except for 2015 and 2016 ASJ, which collected data on inmates held on December 31 (year-end reference date).

The 2015 ASJ collection was combined with the Mortality in Correctional Institutions (MCI, formerly known as Deaths in Custody Reporting Program) collection to reduce respondent burden. The MCI collected data using a year-end reference date, so for the 2015 ASJ collection, items were asked using the year-end reference date rather than the midyear reference date of prior ASJ collections. One item (confined population) was collected using both midyear and year-end dates. The 2016 ASJ continued to use the year-end reference date in collecting detailed inmate counts. In 2017, the ASJ was separated from the MCI and reversed back to the midyear reference date.

Comparisons of year-end data with previous midyear data need to account for seasonal variations, as jails typically hold fewer inmates at year-end than at midyear.

### JUVENILES

State statutes and judicial practices allow juveniles to be incarcerated in adult jails under a variety of circumstances. Because of the differing statutes and practices, however, accurate and comparable data on juveniles are difficult to collect.

Beginning in 1994, the ASJ provided estimates of the total number of jail inmates under age 18, the number held as adults, and the number held as juveniles. New sampling procedures were also introduced in 1994 to minimize the standard errors of these estimates. By stratifying jurisdictions based on the authority to house juveniles, the precision of the juvenile counts was improved. (See methodology section of Prison and Jail Inmates at Midyear 1998).

### JAIL FUNCTIONS

Jails in the ASJ include confinement facilities--usually administered by a local law enforcement agency--that are intended for adults but may hold juveniles before or after they are adjudicated. Facilities include jails and city or county correctional centers, special jail facilities, such as medical or treatment release centers, halfway houses, and work farms, and temporary holding or lockup facilities that are part of the jail's combined function. Inmates sentenced to jail facilities usually have a sentence of 1 year or less. Jails:

- receive individuals pending arraignment and hold them awaiting trial, conviction, or sentencing
- re-admit probation, parole, and bail bond violators and absconders temporarily detain juveniles pending their transfer to juvenile authorities
- hold mentally ill persons pending their movement to appropriate mental health facilities
- hold individuals for the military, for protective custody, for contempt, and for the courts as witnesses
- release convicted inmates to the community upon completion of sentence
- transfer inmates to federal, state, or other authorities
- house inmates for federal, state, or other authorities because of crowding of their facilities
- sometimes operate community-based programs as alternatives to incarceration

## Methodology and Processing

### Data Collection Methodology

*Time Method:* Panel

*Data Collector:* RTI, International

## - Study 39202 -

### *Sampling Procedure:*

The ASJ uses a stratified probability sampling design based on jail population data collected through the most recent Census of Jails (COJ). Jails in the ASJ sample are surveyed annually until the next sample is drawn. The ASJ sample is drawn at the jail jurisdiction level. When a jail jurisdiction with multiple jail operators or facilities is sampled, data are collected from all reporting units within that jail jurisdiction.

The most recent sample refresh occurred in 2020, where a sample of 899 jail jurisdictions was selected to represent the approximately 2,850 jail jurisdictions nationwide based on the 2019 COJ. In selecting jails, all jurisdictions were grouped into 10 strata based on their inmate population and the presence of juveniles at midyear 2019 (table 1). In 8 of the 10 strata, a random sample of jail jurisdictions was selected. The remaining two strata were designated as certainty strata in which all jail jurisdictions were selected. One certainty stratum consisted of all jails that were operated jointly by two or more jurisdictions (referred to as regional jails). The other certainty stratum consisted of all jail jurisdictions that:

- held juvenile inmates and 500 or more inmates on June 28, 2019, or
- held only adult inmates and 750 or more inmates on June 28, 2019.

Twelve of the 899 sampled jail jurisdictions were out of scope due to closure at the time of the 2023 ASJ data collection. As a result, the 2023 ASJ target sample consisted of 887 active jail jurisdictions, represented by 927 reporting units.

BJS recommends aggregating reporting units into jail jurisdictions and analyzing data at the jurisdiction level. Aggregation can be performed in statistical programs such as SPSS ("aggregate" function), SAS (PROC SUMMARY or PROC MEANS function), or STATA ("collapse" function) with the JURISID variable (jurisdiction ID) as the classification variable. Aggregation based on JURISID creates a file where each record corresponds to a single jail jurisdiction. In performing the aggregation, sum up analysis variables (e.g., confined population) and take the average of the weight variable (FINALWT) within each jurisdiction. FINALWT is constant across reporting units within a jurisdiction and reflects the weight given to the sampled jurisdiction, adjusted for non-response.

*Mode of Data Collection:* Data were obtained mainly through web. A small proportion of respondents submitted data by postage-paid mail, email, or fax.

*Type of Research Instrument:* Structured

### *Actions to Minimize Losses:*

To maximize the accuracy of survey, analysis was conducted on out-of-range critical items and the results used to prioritize follow-up contacts. Follow-up telephone calls and emails to non-respondents were used to encourage high response rates. These methods have proved effective in reaching a high response rate while minimizing missing data.

### *Consistency Adjustment:*

A set of data consistency rules were applied to the ASJ raw data reported by respondents to ensure that subgroup populations add up to the total population. The rules apply to total confined population, confined population by sex and juvenile status, confined population by conviction status, confined population by offense type, confined population by race, confined population held for other authorities, total average daily population, average daily population by sex, total admissions and releases, admissions and releases by sex, supervised and unconfined population, and staff.

## **Data Appraisal Information**

### *Response Rate:*

#### *Response Rate and Nonresponse Weighting:*

The 2023 ASJ achieved a response rate of 92%. The final data file includes 865 jail reporting units. Table 2 lists the reporting units that did not respond to 2023 ASJ and those that were out-of-scope due to closure.

Nonresponse weighting was implemented to account for unit nonresponse at jurisdiction level. Jurisdictions were grouped into weighting classes based on sampling stratum and the 2019 inmate population (see table 1). Using a simple weighting class method, the design weight (i.e., sampling weight) of nonresponding jail jurisdictions was equally allocated to each of the responding jails within the same weighting class.

## - Study 39202 -

### *Missing Data Imputation:*

Item response rates ranged from 91% to 100%. For responding jail jurisdictions that were unable to provide some requested items, missing data were imputed. This was done in two steps: first, a last observation carried forward (LOCF) procedure was used to replace the missing values with prior-year data from the same jails; next, for cases with no available prior-year data, a weighted sequential hot-deck (WSHD) procedure was implemented to impute the remaining missing data by borrowing values reported by similar jails in the current year.

In the LOCF procedure, prior-year data were taken from the same jails in the 2020-2022 ASJ and 2019 COJ, adjusted for year-to-year changes as appropriate. Using the LOCF as the first step of imputation increases imputation accuracy because jail population counts and characteristics typically remain relatively stable from year to year. This is especially helpful when imputing missing data for the largest jails that have no comparable-size donor jails (e.g., Los Angeles County Sheriff's Office). Specifically, missing values for rated capacity and inmate populations supervised outside of jail were replaced with last observed values without any adjustment, while missing values in inmate population counts, admissions, and average daily population (ADP) were replaced with last observed values after adjusting for average year-to-year change. The average year-to-year adjustment factor was calculated, for each sampling stratum, as the ratio of the weighted sum of data reported in for the current year to that for last year. Only data from jails that provided data in both years were included in the calculation. By applying the average year-to-year adjustment factor, it was assumed that jails with missing items experienced the average year-to-year percentage change as other jails in the same sampling stratum. Lastly, missing data for inmate subpopulations (e.g., female adults) were imputed based on last year's population distribution and the current year's total inmate population for the same jails.

In the second step, the donor for each missing item in the WSHD procedure was randomly selected from a set of similar jails, sorted by related auxiliary population values. Donor pools, also referred to as imputation classes, were formed by state, ADP category, and regional jail indicator. Within each imputation class, jails were sorted by confined jail population at midyear 2023.

The same two-step procedure was used to impute complete survey data for nonresponding reporting unit(s) in multi-reporting unit jurisdictions. Their imputed values were coded 4 and flagged as "Unit Imputed."

A flag variable is provided for each survey variable to indicate the data processing procedure associated with that item. The values for the flags are as follows:

-9: The item was missing and not imputed

-1: The item was skipped or not applicable

0: The reporting unit reported their actual count for the item

1: The reporting unit provided an estimated count

2: BJS adjusted the reported count for consistency

3: The item was missing and imputed

4: All items for this reporting unit were imputed (The reporting unit did not respond to the survey but was part of a jail jurisdiction that responded to the survey.)

### *Estimates of Sampling Error:*

Below are example SUDAAN codes to generate standard errors to account for the ASJ survey design. The jail(reporting unit)-level data are first aggregated to jurisdiction level, sorted by weighting class. Next, a "total count" SUDAAN statement is used with the variable CLASS\_SUM to provide population counts by weighting class. Finally the weight variable and analysis variables are listed to generate standard errors.

```
proc descript data=ASJ2023_JURIS filetype=ascii means totals design=strwor;
```

NEST CLASS;

totcnt CLASS\_SUM;

weight FINALWT;

var CONFPOP TOTPOP ADP;

Here are example STATA codes to generate standard errors:

bysort CLASS: egen FPC = total(FINALWT)

svyset JURISID [pw=FINALWT], strata(CLASS) fpc(FPC)

svy: total CONFPOP TOTPOP ADP

The above codes provide estimates and estimated standard errors for CONFPOP TOTPOP ADP. To construct a 95% confidence interval for any of the estimates provided, multiply the standard error for the estimate by the z-score of 1.96 (for a 95% confidence interval). For example, the 95% confidence interval for the estimated number of inmates held on June 30, 2023 is 664,199 +/- 1.96 x 6,006, or 652,427 to 676,212.

## Data Access

### Dataset Availability

*Location:* Inter-university Consortium for Political and Social Research

*Extent of Collection:* 1 data file + machine-readable documentation (PDF) + SAS setup file(s) + SPSS setup file(s) + Stata setup file(s) + SAS transport + SPSS system + Stata system + R system file

### Data Use Statement:

*Citation Requirement:* Publications based on ICPSR data collections should acknowledge those sources by means of bibliographic citations. To ensure that such source attributions are captured for social science bibliographic utilities, citations must appear in footnotes or in the reference section of publications.

*Deposit Requirement:* To provide funding agencies with essential information about use of archival resources and to facilitate the exchange of information about ICPSR participants' research activities, users of ICPSR data are requested to send to ICPSR bibliographic citations for each completed manuscript or thesis abstract. Visit the ICPSR Web site for more information on submitting citations.

## Data Files Description

### File-by-File Description

#### File Structure (rectangular)

*File Dimensions:*

- No. of Cases: 865
- No. of Variables: 197
- Record Length: 1,131

*Type of File:* ASCII data file

*Data Format:* Logical record length

*Place of File Production:* Ann Arbor, MI: Inter-university Consortium for Political and Social Research

*Extent of Processing Checks:* The data collection was processed according to the standard ICPSR processing procedures. The data were checked for illegal or inconsistent code values. No consistency checks were performed.

#### Notes

Variable DESIGNWT is for reference only and it is not supposed to be used to calculate national estimate. Users can use variable FINALWT for that purpose.

**Table 1. Sample Design and nonresponse adjustment for 2023 Annual Survey of Jails**

~Not applicable.

<sup>a</sup>Within certainty strata, weighing classes are created based on jurisdiction size (i.e., confined population as of June 28, 2019).

<sup>b</sup>Large jails are those that held at least one juvenile inmate and 500 or more inmates, or 750 or more adult inmates on June 28, 2019.

<sup>c</sup>Regional jail jurisdictions are created by two or more local governing bodies through cooperative agreements.
